Sum of first  $N$  natural numbers →  $\frac{N * (N+1)}{2}$

$$S = 1 + 2 + 3 + \dots + N$$

$$S = N + (N-1) + (N-2) + \dots + 1$$

$$2S = (N+1) + (N+1) + (N+1) \dots N \text{ times}$$

$$\Rightarrow 2S = N * (N+1) \Rightarrow S = \frac{N * (N+1)}{2}$$

$$[3 \quad 8] \rightarrow 3 \quad 4 \quad 5 \quad 6 \quad 7 \quad 8 \quad \text{Ans} = \underline{6}$$

$$[l \quad r]$$

$$\underline{r - l + 1}$$

$$\begin{array}{c} 1 \text{ --- } l \text{ --- } r \\ 1 \text{ --- } l-1 \end{array}$$

$$r - (l-1)$$

$$8 - 3 + 1 = \underline{6}$$

$$= \underline{r - l + 1}$$

---

Q → Given an integer  $N$ , count # factors of  $N$ .

$$N = 5 \rightarrow \{1 \quad 5\} \quad \text{Ans} = 2$$

$$N = 20 \rightarrow \{1 \quad 2 \quad 4 \quad 5 \quad 10 \quad 20\} \quad \text{Ans} = \underline{6}$$

check if  $x$  is factor of  $N \rightarrow \underline{N \% x = 0}$

Smallest factor  $\rightarrow 1$

Largest factor  $\rightarrow N$

$N = 24 \rightarrow \{1, 2, 3, 4, 6, 8, 12, 24\}$

$N = 10 \rightarrow \{1, 2, 5, 10\}$

Bruteforce  $\rightarrow$

cnt = 0

for  $i \rightarrow 1$  to  $N$  {

    if  $(N \% i == 0)$  cnt++  
}

return cnt

#iterations =  $N$

Let's consider for a server it takes 1 sec to run  $10^8$  iterations.

$N = 10^8 \rightarrow 1 \text{ sec}$

$N = 10^9 \rightarrow 10 * 10^8 \text{ iterations} \rightarrow 10 \text{ sec}$

$N = 10^{18} \rightarrow 10^{10} * 10^8 \text{ iterations} \rightarrow 10^{10} \text{ sec}$

$\frac{10^{10}}{60 * 60 * 24 * 365} \approx 317 \text{ years}$

Observations  $\rightarrow$

$N = 24 \rightarrow \{1, 2, 3, 4, 6, 8, 12, 24\}$

$N = 10 \rightarrow \{1, 2, 5, 10\}$

$a \quad b$   
 $N=24 \quad 1 * 24$   
 $2 * 12$   
 $3 * 8$   
 $4 * 6$

$a \quad b$   
 $N=10 \quad 1 * 10$   
 $2 * 5$

$$N = a * b, \quad a \leq b$$

$\downarrow$   
 $N/a$

$$a \leq N/a$$

$$\Rightarrow a^2 \leq N \Rightarrow a \leq \sqrt{N}$$

```

cnt = 0
for a → 1 to √N {
  if (N % a == 0) {
    // b = N/a
    cnt += 2
  }
}
return cnt

```

$N=24 \rightarrow \underline{8}$   
 $a = 1 \ 2 \ 3 \ 4 \ 5 \text{ (stop)}$   
 $cnt = 0 \ 2 \ 4 \ 6 \ \underline{8}$

$N=16 \rightarrow \underline{6}^5 \quad \{1 \ 2 \ 4 \ 8 \ 16\}$   
 $a \rightarrow \{1, 2, 4\}$

```

cnt = 0
for a → 1 to √N {
  if (N % a == 0) {
    if (a == N/a) cnt++
    else cnt += 2
  }
}
return cnt

```

$$1 * 16$$

$$2 * 8$$

$$\boxed{4 * 4}$$

$$N=16 \rightarrow \underline{5} \checkmark$$

$$\# \text{ iterations} = \sqrt{N}$$

$$N=10^{18} \rightarrow \sqrt{10^{18}} = 10^9 \text{ iterations} \rightarrow \underline{10 \text{ sec}}$$

$$317 \text{ years} \rightarrow 10 \text{ sec}$$

## # of iterations

1)  $i = N \quad // > 0$   
while ( $i > 1$ ) {  
     $i /= 2$   
}  
 $i = N \rightarrow \frac{N}{2} \rightarrow \frac{N}{2^2} \rightarrow \dots \rightarrow \frac{N}{2^K} = 1$   
 $\Rightarrow N = 2^K \Rightarrow K = \log_2(N)$   
# iterations =  $\log_2(N)$

2) for  $i \rightarrow 1$  to  $N$  {  
    for  $j \rightarrow 1$  to  $N$  {  
        print ( $i+j$ )  
    }  
}  
# iterations =  $N^2$

3) for ( $i=0$  ;  $i < N$  ;  $i++$ ) {  
    for ( $j=0$  ;  $j \leq i$  ;  $j++$ ) {  
        print ( $i+j$ )  
    }  
}

$i$	$j$	# iterations
0	[0 0]	1
1	[0 1]	2
$\vdots$		
(N-1)	[0 (N-1)]	<u>N</u>
		<u><math>\frac{N * (N+1)}{2}</math></u> $\rightarrow N^2$

Big O  $\rightarrow$  Rate of growth of function.

$$O\left(\frac{N * (N+1)}{2}\right) \rightarrow O\left(\frac{N^2}{2} + \frac{N}{2}\right) \rightarrow \underline{O(N^2)}$$

How to calculate  $TC = O(\# \text{ iterations})$  ?

1) calculate # iterations

2) Neglect lower order term (i.e. contribution is ver less for large value of  $N$ )

3) Ignore constant coefficient

1)  $f(n) = \cancel{3n^2} + \cancel{4n} - \cancel{2}$   
 $O(f(n)) \rightarrow \underline{O(n^2)}$

2)  $f(N) = \sqrt{N} - 2 \log(N) + 3N^2 + 5N \log(N) - 2 + \boxed{N!}$   
 $O(f(N)) \rightarrow \underline{O(N!)}$

for  $i \rightarrow 0$  to  $(N-1)$  {  
    if ( $A[i] == K$ ) return true  
    }  $\swarrow$  i/p  
return false

$(A[0] == K)$       best      worst

1      N ✓

$SC = \underline{O(1)}$        $TC = \underline{O(N)}$

# iterations

---

Space Complexity  $\rightarrow$  Rate of growth of memory wrt i/p.

int  $\rightarrow$  4B

long  $\rightarrow$  8B

// i/p  $\rightarrow$  N

1) { int  $x = 10$        $\rightarrow$  4B      Total = 12B  
    long  $y = x * N$        $\rightarrow$  8B       $SC = \underline{O(1)}$   
}

2) // i/p  $\rightarrow N$

{ int  $x = N/10 \rightarrow 4B$  Total =  $(4 + 4N) B$

int  $a[] = \text{new int}[N] \rightarrow (4 * N) B$  SC =  $O(N)$   
}

Input  $\rightarrow$  Algorithm  $\rightarrow$  Output

Extra space  
apart from i/p & o/p.

---

TLE  $\rightarrow$  (Time Limit Exceeded)

Processing speed of online editors  $\rightarrow$  1 GHz

Allowed time limit = 1 sec

$10^9$  instructions/sec

$a + b,$   
 $a = 2, \text{ etc.}$

Let say, in 1 iteration  $\rightarrow$  10 to 100 instructions

$10^9$  instructions  $\rightarrow$  1 sec

$10^7 * 100$  instructions  
 $= 10^7$  iterations

$10^8 * 10$  instructions  
 $= 10^8$  iterations

Usually in 1 sec  $\rightarrow$   $10^7$  to  $10^8$  iterations

## Constraints

$$TC = O(N^2)$$

$$1 \leq N \leq 10^3 \rightarrow 10^3 * 10^3 = 10^6 \text{ iterations } \checkmark$$

$$1 \leq N \leq 10^5 \rightarrow 10^5 * 10^5 = 10^{10} \text{ iterations } \times \text{ (TLE)}$$

## Bitwise Operators

1  $\rightarrow$  set bit / true

0  $\rightarrow$  unset bit / false

A	B	AND	OR	XOR	$\rightarrow$ 1) add without carry 2) same same puppy shame $\checkmark$
		A & B	A   B	A ^ B	
0	0	0	0	0	
0	1	0	1	1	
1	0	0	1	1	
1	1	1	1	0	carry $2 \rightarrow 10$

$\swarrow$   
res = 1,  $\forall$  bits = 1

$\downarrow$   
res = 1, any bit = 1

A	$\sim A$ (Not)
1	0
0	1

$$12 \rightarrow \begin{matrix} 3 & 2 & 1 & 0 \\ 1 & 1 & 0 & 0 \end{matrix}$$
$$9 \rightarrow \begin{matrix} 3 & 2 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{matrix}$$

$$12 \& 9 \rightarrow \begin{array}{r} 1100 \\ \& 1001 \\ \hline 1000 \end{array} \rightarrow 8$$

(Ans)

$$12 \wedge 9 \rightarrow \begin{array}{r} 1100 \\ \wedge 1001 \\ \hline 0101 \end{array} \rightarrow 5$$

(Ans)
